17. A new method for calculating the polarity of the chemical bond.
B. Lakatos, J. Bohus, Magyar Kemiai Folyoirat, Vol. 64, 1958, No. 7-8,
pp. 269-270, 3 figs., 1 tab.

The degree of polarity p of a compound as defined by Fajans could be calculated only with the use of several experimentally stated values of p . The concept of the "effective electric field intensity" $F^* = Z^* \cdot e/r^2$ of atoms and ions respectively was introduced for determining p quantitatively on the basis of Fajans' electrostatic approximation ("quanticule theory") and from polarization rules. The effective nuclear charge Z^* was calculated according to Lisitzine and Kohlrausch. The radius is $r = 0.85(n^*)^2/Z^*$. In equilibrium the F^* values of the anionic and cationic components are equal: $Z_A^* + 8 \quad Z_B^* - 6$

where the partial charge $\delta = P \cdot \delta_{\max}$. It is proved that the relationship between F^* and P is $F^* = a \cdot e^{bP}$ from which $\ln F^* = bP + \ln a$. Thus the $\ln F^* = f(P)$ straight line of the cation and anion. In case of an

A new way for the calculation of the degree of polarity of chemical bonds, IV. Dependence of the charge at the elements of field D. (In English) B. Lakatos, J. Bohus, Gy. Medgyesi. *Acta Chimica Academiae Scientiarum Hungaricae*, Vol. 21, 1959, No. 3, pp. 293-328, 10 figs, 6 tabs.

Using the most reliable ionization and excitation potential data of literature, the authors calculate the fundamental atomic constants, the effective nuclear charge numbers (Z^*), the screening numbers (S), the effective principal quantum numbers (n^*), radii (r) and the absolute values of the effective electric field strengths (F^*) for the free atoms and ions of the transition metals (D field). These calculations were made for pure d states. The values thus obtained are relatively the most reliable in the 3d range but less so in the 4d range due to uncertain ionization potential data. The Lisitzin-Kohlrausch interpolated values were used in the 5d range. In the course of further investigations the authors found that

in a range interesting from the viewpoint of the chemical binding forces the effective field strength of free transition metal atoms and ions is an exponential function of their charge. A relationship highly accurate in the whole range was found according to which the square root of the effective electric field strength is a linear function of the charge. Taking into account that during the formation of a chemical bond in equilibrium state the effective electric field strength of the cationic constituent equals that of the anionic, the estimation of the degree of polarity of the bond formed by transition metal atoms becomes possible with the aid of the formula

$$P = \frac{\log F_B^* - \log F_A^*}{(\log F_A^* - \log F_A^*) \delta_{\max}^{(A)} + (\log F_B^* - \log F_B^*) \delta_{\max}^{(B)}}$$

The values thus obtained are in good agreement with others stated in literature.

TITLE:

Experiments on the formation of transition metallic
compounds with pseudo-aromatic inorganic ligands. I.
Phosphorus nitrilo-compounds

PERIODICAL:

Magyar kémiai folyóirat, no. 9, 1961, 374-378

TEXT: The article, the first of a series, describes the investigations carried out to examine the complex-forming tendency of pseudo-aromatic inorganic ligands. This tendency, however, according to available literature, is doubtful. For the experiments, phosphorus nitrilo compounds were used. First, the trimer-ring phosphorus nitrilo-chloride was subjected to reaction with anhydrous ferrous (II) chloride, ferrous (II) bromide and ferrous (II) iodide in the presence of aluminum chloride as catalyst. This experiment was carried out in nitrogen and in a closed tube, but in both cases with negative results. Another experiment using a mixture of ferric (III) chloride and "ferrum reductum" also proved negative. So was the experiment with ferrous(II) chloride and ferrous(II)

bromide. The reciprocal reaction of anhydrous transition metallic salts and $(\text{PnCl}_2)_3$ in solutions made with various organic solvents was also investigated. The strongest change in color occurred when an acetone solution of cupric (II) acetate and cupric (II) chloride was used. The absorption graphs of various solutions are shown in Fig. 1. It was found that a fresh solution of $(\text{PnCl}_2)_3$ in anhydrous acetone, reacted with acetone solution of cupric (II) acetate, gave an orange colored complex very slowly, while a stale solution of $(\text{PnCl}_2)_3$ in acetone reacted immediately. The absorption spectra of both solutions are identical as shown in Fig. 4. The results of conductivity tests of 0.01 mol $(\text{PnCl}_2)_3$ are listed in Table 1.

Tests revealed that the orange complex was produced by the enol form of acetone and copper (II) ions. N. A. Shlovokhotova, Soviet researcher, proved that LiBr , NaJ , $\text{Co}(\text{NO}_3)_2$ and ZnBr_2 salts catalyze the keto-enol tautomerism of acetone and that Li , Ca , Na and Zn ions produce enolate or enol complex with the enol form of acetone. The existence of these complexes was confirmed by Shlovokhotova by infrared absorption spectrum

TOPIC TAGS: scientific research, scientific policy

ABSTRACT: The question of the compensation for discoveries that were within the frame-work of the planned activities in an Institute are discussed. The author feels that compensation should be given only after the invention was proved in practical application; however, this should not lead the research personnel to select for work only such problems that appear easy to put into practice. The earnings of the research workers should not be uniform; the personnel should be recruited among the most capable people who now prefer to work in production rather than in research, because of better earnings. In future, research progress must be evaluated both from the point of view of immediate improvements, and long-term progress. Tasks connected with a long-term progress must be financed by higher authorities, not by individual National Enterprises. [JPRS]

Title : Parasites of the Cotton Cutworm Moth Bred in the Turkmen
Soviet Socialist Republic.

Orig Pub : Entomol. obozreniye, 1957, 36, No 1, 98-107

Abstract : Twenty-three parasitic species were found on the larvae of the cotton cutworm moth, among them two species of chalcids, five species of ichneumonids, ten species of braconids, two species of parasitic wasps, four species of tachine flies (the parasites of the eggs and pupae were not taken into account). The role of the parasites in limiting the numbers of the cotton cutworm moth varied with diverse crops and different regions. The species of the genus *Habrobracon* (ectoparasites) were most important on crops under plowing. In the Merv oasis the *habrobracons*

"Basic Principles of Operative Treatment of Thermal Burns by the Method of the Free Skin Graft"

Bucharest, Revista Sanitara Militara, Vol 16, Special No., 1965; pp 174-175

Abstract: Concise review of optimal conditions for free auto- or (temporary) homo-transplantation of skin; extent of burn surface; as to time, 15 to 30 days after burns seem to be the limit (freedom from infection); hemoglobin, blood proteins and electrolytes status. Brief summary of procedure and results in 1000 patients, generally with successful outcome.
